

# Contents

---

## 1 Data Ingestion and the NEM

The wholesale market, AEMO data, timestamps, arcsinh transform

## 2 Price Distribution and Stylised Facts

Duck curve, heavy tails, autocorrelation, volatility clustering

## 3 Price Formation

Merit-order supply stack, hockey stick, spike anatomy, bidding

## 4 Weather and Renewables

ERA5 reanalysis, clear-sky index, wind power curves, temperature

## 5 Forecasting Framework and Baselines

Rolling-origin backtest, naive baselines, battery dispatch LP, capture ratio

## 6 Classical Models: LEAR

Linear regression, LASSO regularisation, per-hour models, Diebold-Mariano

## 7 Machine Learning

Gradient boosting, LightGBM, quantile regression, neural networks

## 8 Probabilistic Forecasting

QRA, calibration, CRPS, conformal prediction, spike coverage

## 9 From Forecast to Money

Scenario MPC, chance-constrained MPC, value of information, economics

## 10 Capstone: Sunlight to Revenue

End-to-end pipeline, grey-box models, ablation, limitations

**How to use this guide:** Each chapter corresponds to a hands-on notebook. Read the chapter first to understand the concepts, then work through the notebook to apply them. Every technical term is defined in blue definition boxes. Real-world examples appear in orange boxes. Key insights are highlighted in green boxes. Each chapter ends with a glossary of all terms introduced.
